Comments:

It is not a forest nor a wild place; this is planet Earth, the very Earth that, "alone", generates and releases all of mankind's required lifelines for life itself, scientifically, wild, natural ecosystems. All ecosystems are created, supported, serviced, maintained and protected only by all wild, native species of plants, trees and animals or biological diversity and bio means, "life", the strands in the web of all life.

Some species of biological diversity are more vital and necessary or vital keystone species, like wolves. The wolf is the total salvation of the evolutionary event that provided life as we know it -- the appearance of green trees and plants on the land's surface. When we conserve and protect ecosystems and biological diversity, we protect all life on Earth as we know it. "Planet Earth is in a free-fall and the planet's support systems are so stretched that we face widespread species extinction and mass human migration unless urgent action is taken. That's the warning hundreds of scientists are preparing to give and it's "stark".

"We are at a crossroads. The historic and current degradation and destruction of planet Earth undermine human well-being for current and countless future generations." "Land degradation, biological diversity loss and climate change are three different faces of the same central challenge...the increasingly dangerous impact of our choices on the health of planet Earth."

"In Wildness is the salvation of the Earth and the preservation of all life, long known among wolves and planet Earth but seldom perceived by man."
